Personal Projects

POC: BookList Application with CURD Functionality

- The BookList Application is a simple web application built using React functional components and utilizes local storage for data persistence.
- The application provides basic CRUD (Create, Read, Update, Delete) functionality to manage a list of books.
- Users can add new books, view the existing book list, update book details, delete individual books, and clear the entire book list.

POC: Counter Application using Redux

- The Redux Counter Application is a straightforward web application developed to demonstrate the integration of Redux for state management in a React application.
- The application features a counter that users can increment, decrement, or reset to its initial value.
- By employing Redux, the project showcases a centralized and predictable way of managing state, providing a clear separation of concerns between components and state management.

POC: Redux Thunk Data Fetching Application

- The Redux Thunk Data Fetching Application is a React web application that employs the Redux Thunk middleware to retrieve data from an external API and manage it within the Redux store.
- The project highlights the integration of asynchronous actions using Redux Thunk, allowing for efficient and organized data fetching and management.
